

the Trueness Meter Program

The **Trueness Meter Program** involves taking a concise set of measurements to assess the performance and quality of greens on your golf course including green speed, firmness, smoothness, trueness, organic matter, and moisture content.

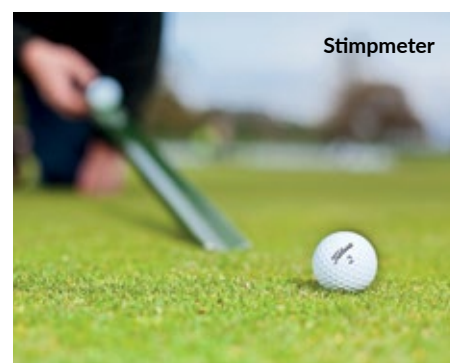

The results are compared against target performance levels and across the golf course for consistency. These measurements are analysed and interpreted by our sportsturf agronomists, in partnership with the superintendent, to provide valuable input into the management of your greens.
